## HISTORICAL CONTEXT OF THE DMITRY ALEXANDROVICH BURIAL

The burial of Prince Dmitry Alexandrovich, the son of Alexander Yaroslavich Nevsky, was investigated by the architectural and archaeological team of the Institute of Archeology of the Russian Academy of Sciences under the leadership of V.I.V. Sedov. Dmitry Alexandrovich is a prominent figure in the political history of the second half of the XIII – the first quarter of the XIV century. Below is detailed historical evidence of this burial and archaeological materials underlying its attribution.

Prince Dmitry Alexandrovich (1250–1294), the second son of Prince Alexander Yaroslavich, who after the death of his father (1263) assumed his inheritance – the Principality of Pereyaslavl. In different years prince Dmitry Alexandrovich occupied the Novgorod and the great Vladimir reigns. Being in the Novgorod principality, he participated in a campaign against Derpt (1262), in the Battle of Rakovor, the victory in which was largely ensured by the actions of his regiment (1268), undertook a campaign against the Karelians (1278), and built a stone fortress in Koporye (1280) that was soon destroyed by the Novgorodians. As the eldest in the family after the death of his uncle Vasily Yaroslavich, Dmitry Alexandrovich assumed the great throne in 1276 and from 1281, with varying degree of success, fought for the Vladimir with his younger brother Andrei Gorodetsky, and as the result was forced to finally relinquish the great reign in 1294. Dmitry Alexandrovich died on Volok Lamsky on his way to Pereslavl from Tver, and he was buried in Pereslavl (Complete collection of Russian chronicles, vol. 1, 282 p.; Complete collection of Russian chronicles, vol. 3, 328 p.). At the same time, a number of chronicles (including the 4th Novgorod chronicle, the Moscow chronicle of the late XV century, Voskresenskaya and Nikonovskaya chronicles) contain direct references to the fact that he was buried in the Transfiguration Cathedral of Pereyaslavl-Zalesky (Complete collection of Russian chronicles, vol. 4, 249 p.; Complete collection of Russian chronicles, vol. 25, 157 p.; Complete collection of Russian chronicles, vol. 7, 181 p.; Complete collection of Russian chronicles, vol. 13, 170 p.).

The search for the burial place of Prince Dmitry Alexandrovich in the Transfiguration Cathedral is made easier by the fact that this temple was used as a prestigious tomb in the Middle Ages less often than many others. The chronicle preserved information about only two princely burials committed here:

except for Prince Dmitry Alexandrovich, his son Ivan, who died in 1302, was buried here. With the death of Ivan, who died childless, the Pereyaslavl principality passed to Moscow. An indication of the location of the burial place of Dmitry and Ivan is given by the earliest description of the cathedral known to us (1702), "Documents on the finding of inscriptions in the cemeteries of monasteries and churches" of Pereyaslavl 1792–1793, an engraved plan of the cathedral in the middle of the XIX century, and observations by academician V.V. Suslov, who supervised the restoration work in the cathedral in 1891. Based on these documents, it can be surmised that the burial of Ivan Dmitrievich took place in the southwestern part of the cathedral, under the choirs, and the burial of Prince Dmitry Alexandrovich was in the southeastern part, in the southern altar apse. Before the restoration of 1891, there were brick tombstones of the XVII century marking the places of burial here.

In 2014, in connection with the planned restoration work in the Transfiguration Cathedral and next to it, a series of pits were dug and a previously undocumented and closed with a wooden plug pit was opened in the southeast corner of the cathedral. In the pit, the remains of a white-stone sarcophagus were found in the form of a quadrangular box, slightly expanding to the west, shallow, with fragments of a broken lid. The sarcophagus was placed along the wall of the temple. The southwest corner (headboard), partially the southern wall, and, partially, the bottom of the sarcophagus have been preserved. The length of the sarcophagus is 165 cm, the width is 60 cm, the thickness of the side wall is 5 cm, and the height is 32 cm. Near the sarcophagus, in the filling, scattered human bones were found. A whole series of bones

**Fig. 1.** Remains from the destroyed sarcophagus of the Transfiguration Cathedral of Pereslavl. The first cervical vertebra, rear view. The different inclination of the surfaces marked with arrows is clearly visible

was found in the head of the sarcophagus, covered with earth. The shape of the sarcophagus is typical of the XIII–XIV centuries. The identification of the remains from the sarcophagus as the burial place of Prince Dmitry Alexandrovich is thus based on a combination of historical accounts about the burial, archaeological data, and anthropological principles.

The remains found in the context of the crypt are represented by several bones:

1. First cervical vertebra.
2. 3rd cervical vertebra.
3. Two vertebrae of the upper part of the thoracic spine.
4. One lower thoracic vertebra.
5. One lumbar vertebra.
6. First rib right.
7. Top rib left.
8. Bones of the right hand: metacarpal bone of the first ray, metacarpal bone of the third ray, hyoid bone.
9. Bones of the left hand: metacarpal bone of the first ray. Metacarpal IV ray, proximal phalanges III and IV ray.
10. Bones of the left foot: proximal phalanx of the 1st ray of the left foot.
11. Bones of the right foot: sphenoid bone.

The preservation of the bone tissue is good, which is typical for a bone that was out of contact with the ground for a long time after burial and suggests a rather late episode of the destruction of the sarcophagus.

The condition of the articular surfaces of the small joints of the hand and foot denotes the presence of osteophytes and arthrosis on the vertebrae of the cervical and thoracic regions. A significant functional relief on the bones of the hand, the presence of a local spot of “polishing” on the first cervical vertebra, allow us to believe the age of a person as mature. The lack of a complete skeleton makes it difficult to determine the exact age. It is reasonable to use a wide age range: 35–49 years. The dimensions of the bones of the hand allow us to consider that the remains belonged to a man. An asymmetry of the inclination of the right or left upper and lower articular fossae of the first vertebra (atlas) was noted, which suggests that the head position slightly retracted to the left side was typical for the individual.

**Fig. 2.** Remains from the destroyed sarcophagus of the Transfiguration Cathedral in Pereslavl. Deformation of the articulated surfaces of the third cervical vertebra

**Fig. 3.** Remains from the destroyed sarcophagus of the Transfiguration Cathedral of Pereslavl. Osteophyte on a fragment of the body of the thoracic vertebra

# Supplementary 3

**Table.** Results of test sequencing of aDNA fragment libraries

ID of the library	Original number of reads	Number of reads after filtering	Number of reads mapped on hg19	After removal of PCR duplicates	Endogenous DNA, %
Nev2.1	3301880	2513126	98603	46149	1.84
Nev2.2	4447600	3978101	655440	618891	15.56
Nev2.3	3774011	3213975	515504	470264	14.63

# Supplementary 4

Frequency of C to T substitutions at the 5' ends of aDNA fragments for the NEV2.1, NEV2.2, and NEV2.3 samples

# Supplementary 5

## RESULT OF ASSESSING THE CONTAMINATION OF THE SAMPLE ACCORDING TO SUCH PARAMETERS AS THE DEGREE OF HETEROZYGOSITY OF mtDNA AND X-CHROMOSOME

**Table 1.** Result of assessing the contamination of the sample according to such parameters as the degree of heterozygosity of the X-chromosome with mathematical methods "MoM" (Methods of Moments) and "ML" (Maximum Likelihood) (Mathieson, 2015)

Library ID	Number of SNP	MoM	SE (MoM)	ML	SE (ML)
NEV_2.3	3957	1,13%	1,75E-03	1,29%	1,22E-14

**Table 2.** Result of assessing the contamination of the sample according to the degree of mtDNA heterozygosity

Library ID	Heterozygosity of mtDNA	X/Y
NEV_2.3	0,46%	0,900329024
